

The Kitchen press

A new take on the industrial hydraulic press

What can the Kitchen press do?

- The kitchen press is a machine which can crush anything under its piston.
- What this allows it to do is crack nuts and and crush things like cocoa beans to create cocoa powder
- In the kitchen presses design there is a grate you can put on the piston of the press which allows it to chop any kind of food, for example you can put a piece of garlic on the steel chopping tray below the piston and then put the mince grate on the piston and it will mince the garlic

What's so great about the Kitchen press

- The kitchen press uses a design which makes a lot more smaller and compact than previous industrial designs which allows it to fit in your kitchen with other household appliances
- The kitchen press comes in two different versions, one being electric which requires no manual labor but needs a 12v outlet. This one is sold for \$349.99
- The other version is the handpump version which uses a pump to manually create pressure to work. The benefits of this are it requires no power and it cost 249.99 unlike the electric one
